

Press Release 05/2011

The new Dynaudio Focus series

The new Focus series is clearly the Dynaudio highlight at this year's HIGH END 2011.

The current Focus models debuted at the HIGH END 2005 in Munich and soon became as Dynaudio's most successful series. Based on these successful models, every model now has been improved in every way: New midrange and bass drive units, a refined cabinet shape and more modern styling, improved cabinet construction, new fine-tuned crossovers, and last not least an additional all-new floorstand model.

Also new in the Focus series is an additional real-wood cabinet finish: Walnut, which especially looks stunning in combination with the new silver-grey coloured driver rings. In addition to Piano White and Piano Black lacquer, which will be available for every model without surcharge, six finishes will now be available for the new Focus series.

All five new Focus models will be shown for the very first time at the HIGH END 2011 - a true world premiere.

Focus 160

The cabinet construction has been improved for lower resonance and greater rigidity and enables an even better performance of the woofer.

The Focus 160, especially in medium to smaller sized rooms, positioned on the optional Dynaudio Stand⁴ for example, amazes with incredible speed, excellent micro-dynamics, natural musicality, a wide open soundstage and an exceptionally precise and homogenous sonic performance down to the lower bass.

Focus 260

Due to the relatively slim cabinet, which stands less than 1 meter tall, an ideal sound radiation is ensured – even at short listening distances.

The Focus 260 thus combines the same excellent speed, expansive soundstage, incredibly natural musicality and extremely accurate and homogenous balance of the compact Focus 160 with added low-bass dynamics and presence, and is perfectly suited for medium to larger sized rooms.

Focus 340

The new developed model Focus 340 offers more of everything.

The dual 18 cm woofers have been developed especially for the Focus 340 and feature extra-large cone surfaces, the new black Kapton® voice coil formers and rigid die cast aluminum baskets, all housed in an ultra-rigid cabinet construction. The result is an impressive floor-standing loudspeaker with an incredibly dynamic, fast, accurate and open sonic performance, mated to a deep, powerful yet extremely precise bass response.

Press Release 05/2011

Focus 380

Especially in larger rooms, a precise balance between high, mid and low frequency ranges is imperative – and the Focus 380 is ideally suited for this task.

The mid/woofer and woofer cones utilize the proprietary MSP material in order to achieve a seamless sonic integration, while Dynaudio's finest soft dome tweeter design is employed to reproduce the high frequencies: The Esotar2. The overall musical performance is stunning: The Focus 380 is rich in detail, high in resolution but smooth in the high frequencies; open and precise in the midrange, and powerful and absolutely rock-solid in the bass and low bass registers: a loudspeaker for every room and any style of music.

Focus 210 C

Any home theater system is only as good as its center channel loudspeaker allows, as the center is the heart of the system.

The Focus 210 C center channel loudspeaker is thus equipped with the same high-quality Dynaudio soft dome tweeters and MSP mid/bass drivers in order to ideally complement the Focus models.
